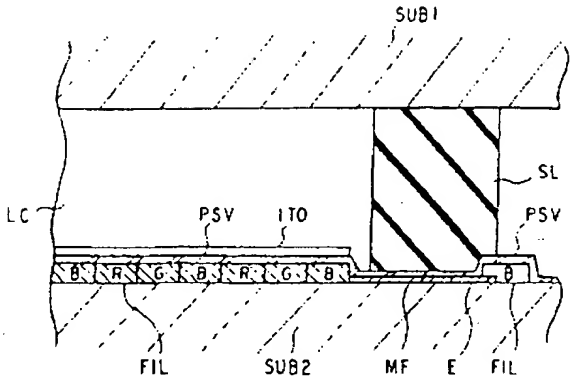
TITLE : LIQUID CRYSTAL DISPLAY DEVICE



ABSTRACT : PURPOSE: To prevent the peeling of a sealing part, short circuit, electrolytic corrosion and disconnection and to enhance yield and reliability by providing a metallic film for shielding light in contact with a transparent glass substrate between the sealing material and the substrate and covering the outer end part of the metallic film a color filter.

CONSTITUTION: Between the transparent glass substrate SUB 2 and the sealing material SL, for example, the metallic film MF in contact with the substrate SUB 2 is provided so as to shield the light for the sealing part. The outer end part of the metallic film MF is covered with the color filter FIL. Furthermore, the metallic film MF being a light shielding film can be provided so that the thickness thereof may be made thinner than that of the color filter being a conventional light shielding film. Thus, the peeling of the sealing part is prevented and also the short circuit, the electrolytic corrosion and the disconnection, etc., caused by the adhesion of water to the metallic film MF are prevented. Then, a gap between the substrates SUB 1 and SUB 2 is easily controlled and the reliability and the yield of products are enhanced.
